

Rev1 has been a provider of technical and engineering services to the power industry since 2001. Our wind turbine Construction Quality Inspections help protect the value of our client's projects through diligent, onsite supervision of construction, mechanical completion, and commissioning of each turbine.

top to bottom inspections

- OEM specific technicians
- Installation manual review
- Objective expert oversight
- Detailed daily reports
- Electronic reporting

When it comes down to Value, Construction Quality Inspections make perfect sense.

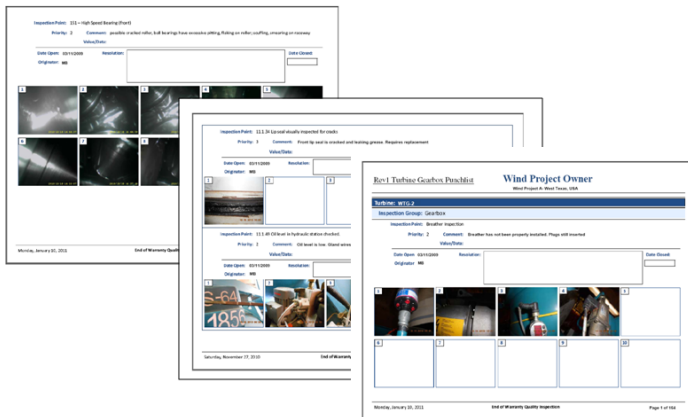

INSPECTION FINDINGS

Inspection findings are captured on our Rev1 Tracker application. Each report presents a comprehensive assessment of the turbine, providing you with critical knowledge of its condition as you prepare to take over the project.

How turbine components are handled during transportation to the project site, storage, and field construction can play a significant role in the long-term profitability of a Wind project. Our services help you protect the value of your investment by providing thorough, top to bottom inspections during the receiving, construction, and mechanical completion phases. We deliver reports of concise and relevant findings that save you time and significantly reinforce your ownership position.

Rev1 understands your needs when it comes to construction QA support. Our teams are assembled with specific, OEM-platform experience, giving them the ability to quickly recognize common and recurring turbine erection issues, construction short-cuts that cost you money, and frequent problems that delay assembly and commissioning.

We provide the necessary QA oversight on receiving of components, proper storage, turbine bolting, wiring, and component assembly. Through our daily onsite inspections and reporting, we are able to broaden the authority of your construction manager to safely and professionally manage your project.
