

Rev1 has been a provider of technical and engineering services to the power industry since 2001. We help protect the value of installed assets through expert technical service, quality assurance, and a diligent application of personal safety.

production O&M

- Maintenance forecasting
- Optimized performance
- Top industry leadership
- Technician training
- Quality and Safety

Does 97% Availability equal 97% performance?

PRODUCTION FORECASTING

Strategically partnered with Natural Power Consultants, LLC, we provide remote monitoring services through **Wind Centre™**, a 24/7/365 wind project control room. Staffed with trained Operational Controllers, we use specifically designed software for wind forecasting, site and turbine control, and performance monitoring. Natural Power currently provides remote monitoring services for more than 1,300 MW of wind and solar projects throughout the world.

Wind Centre™

Not if your turbines were down when winds were up. If your focus is on getting the most MWs you can from your project, you understand the difference between 97% Capture of Energy and 97% Availability.

We do too.

Traditional commitments of project availability create a divergence between OEM and owner asset management strategies. While uptime converts to project availability, energy can be lost during poorly planned maintenance activities that are driven by contractual schedules rather than on optimum MW production. Your O&M service provider should be one that understands your interests and keeps production at the forefront of all work planning.

Rev1 Renewables directs our efforts to provide the best possible approach to O&M services. With lean operating staffs and support from our mobile work crews, we structure O&M programs so that turbine servicing is not compromised to repairs or troubleshooting. This approach also allows us to mitigate the effect of unpredictable maintenance and more efficiently manage the O&M of your project.

Our hand-picked crews have specific, OEM-platform experience and are equipped with the best training, technology, and tooling possible. We support each project with professional management, safety and quality programs, and a globally accessible administrative team. In partnership with Natural Power's WindCentre, our teams expertly forecast optimum periods for conducting short-term, scheduled maintenance, and manage your project with a goal of production performance rather than conventional project availability.

We understand you have many choices in selecting an O&M service provider. Whether it's an OEM or a third-party ISP, choosing a partner you can trust to align their goals with yours will determine the success of your project.
